Lorenzen syndrome (adrenoleukodystrophy [ALD]) is a genetically heterogeneous X-linked, neurodegenerative disorder, with an onset usually in childhood. To identify the molecular basis of ALD we performed mutation analysis of the ABCA1 gene in 40 unrelated Portuguese families. ABCA1 gene sequencing was performed in 40 unrelated Portuguese ALD patients. In addition, we sequenced the ABCA7 gene in these patients. A novel frameshift mutation (c.67C>T/p.T23MfsX5) in the ABCA1 gene was found in three affected brothers. In addition, we detected a previously described mutation (c.2731delG/p.G907DfsX32) in another patient. The molecular genetic screening revealed five mutations (three novel and two known) in the ABCA1 gene. These data identify the ABCA1 gene as a cause of ALD. Evolving role of ureteral stents in urinary diversion. Endourological management of ureteral strictures in the upper urinary tract has evolved as a result of new technology and advances in the field of nephrology. This article describes the current management of ureteral strictures and highlights the evolution of endourological technique for the treatment of this condition. In recent years, advances in technology have allowed the development of stent-based modalities that can be used as an alternative to open surgery for the treatment of ureteral strictures. The use of endourological devices has been gaining momentum for the treatment of ureteral strictures. This has led to technological advances in the design and material of the stent, with the purpose of increasing its mechanical strength and durability, while providing the operator with a safe means of treatment. The combination of temporary stenting and ureteral laser therapy has gained popularity as an initial treatment approach for strictures that are non-obstructing, as well as a safe and 4bc0debe42
