system for the treatment of osteosarcoma. Osteosarcoma is the most common primary malignant tumour affecting the skeletal system and has a high mortality rate. Treatment options for osteosarcoma are surgical resection, chemotherapy and radiotherapy. The poor response to therapy and intrinsic resistance of osteosarcoma cells to chemotherapy and radiotherapy restrict their effectiveness. Liposomes are novel and efficient carrier vehicles capable of improving the solubility, stability and release of drugs. Liposomes have been used for the delivery of drugs against different cancer types. In this study, we evaluated the potential of liposome-encapsulated doxorubicin as a drug carrier for the treatment of osteosarcoma. I raced my brothers and sisters. I played almost every sport I could find. It was my life. Little did I know that I would become a world-class athlete. I would eventually be a
