xforcekeygenNavisworksManage2017crackThe use of zebrafish to identify genes that underlie cardiovascular phenotypes in human diseases.

Zebrafish as a preclinical model for human cardiovascular disease. Here we review the past and current uses of zebrafish in the study of cardiovascular physiology and disease. Originally used to study heart development and myofibrillar organization in the heart, cardiac and vascular development in the zebrafish has proven useful for identifying genes that underlie heart development, disease and regeneration. A number of genes involved in cardiovascular disease in humans, including mutated genes in cardiovascular development and function, could be probed in the zebrafish to examine the impact of these mutations on cardiovascular function and viability. A number of cardiovascular diseases have now been modelled in zebrafish. For example, in humans, congenital heart disease affects approximately 3% of newborns, and this percentage is expected to increase in the future. Zebrafish have the ability to model many of the phenotypes of human congenital heart disease in a rapid, inexpensive and facile fashion. Moreover, the zebrafish has the advantages of low cost, accessibility, ability to perform genetic screens for phenotype rescue, and its rapid and versatile embryonic development. The zebrafish is

therefore proving to be a powerful, cost-effective tool for the study of cardiovascular disease. The identification of genes and pathways that underlie phenotypes of human cardiovascular disease is critical for developing preventative strategies and developing a deeper understanding of disease mechanisms. Given that zebrafish can serve as a model for a wide array of cardiovascular disease, including the transcriptional regulation and function of the heart, the vasculature, and the kidney, they can serve as a powerful model for cardiovascular studies and discovery.

Jonathan,
Here is the "Current Volume Access" status for the Entergy/Hess Pipeline. Thanks, Kenny
